

Section 6.3

Matrix Multiplication

Dr. Abdulla Eid

College of Science

MATHS 103: Mathematics for Business I

Goal: To define a multiplication between two matrices A and B .

When this is possible?

This is possible if the number of columns of A is the same as the number of rows of B .

$$A_{m \times n} \cdot B_{n \times k} = AB_{m \times k}$$

Example

Multiply

$$(1 \ 3 \ 2) \cdot \begin{pmatrix} 1 \\ 1 \\ 3 \end{pmatrix}$$

Solution:

$$\begin{aligned} & \begin{pmatrix} 1 \\ 1 \\ 3 \end{pmatrix} \\ (1 \ 3 \ 2) & (1(1) + 3(1) + 2(3)) \\ & = (10) \end{aligned}$$

Example

Multiply

$$\begin{pmatrix} 1 & 2 \\ -3 & 4 \end{pmatrix} \cdot \begin{pmatrix} 1 & 0 \\ 5 & 6 \end{pmatrix}$$

Solution:

$$\begin{aligned} & \begin{pmatrix} 1 & & & 0 \\ & 5 & & 6 \end{pmatrix} \\ \begin{pmatrix} 1 & 2 \\ -3 & 4 \end{pmatrix} & \begin{pmatrix} 1(1) + 2(5) & 1(0) + 2(6) \\ -3(1) + 4(5) & -3(0) + 4(6) \end{pmatrix} \\ & = \begin{pmatrix} 11 & 12 \\ 17 & 24 \end{pmatrix} \end{aligned}$$

Example

Multiply

$$\begin{pmatrix} 1 & 0 \\ 5 & 6 \end{pmatrix} \cdot \begin{pmatrix} 1 & 2 \\ -3 & 4 \end{pmatrix}$$

Solution:

$$\begin{aligned} & \begin{pmatrix} 1 & 0 \\ 5 & 6 \end{pmatrix} \begin{pmatrix} 1 & 2 \\ -3 & 4 \end{pmatrix} \\ & \begin{pmatrix} 1 & 0 \\ 5 & 6 \end{pmatrix} \begin{pmatrix} 1(1) + 0(-3) & 1(2) + 0(4) \\ 5(1) + 6(-3) & 5(2) + 6(4) \end{pmatrix} \\ & = \begin{pmatrix} 1 & 2 \\ -13 & 34 \end{pmatrix} \end{aligned}$$

Note: From the previous two examples, we have $AB \neq BA$.

Example

Multiply

$$\begin{pmatrix} 5 & 7 & 2 \\ 1 & 2 & -3 \end{pmatrix} \cdot \begin{pmatrix} 2 & 1 \\ -3 & -2 \\ 5 & 0 \end{pmatrix}$$

Solution:

$$\begin{pmatrix} 5 & 7 & 2 \\ 1 & 2 & -3 \end{pmatrix} \begin{pmatrix} 2 & 1 \\ -3 & -2 \\ 5 & 0 \end{pmatrix} = \begin{pmatrix} 5(2) + 7(-3) + 2(5) & \\ & \end{pmatrix}$$

continue...

$$\begin{pmatrix} 5 & 7 & 2 \\ 1 & 2 & -3 \end{pmatrix} \begin{pmatrix} 2 \\ -3 \\ 5 \end{pmatrix} \begin{pmatrix} 1 \\ -2 \\ 0 \end{pmatrix} \\ \begin{pmatrix} 5 & 7 & 2 \\ 1 & 2 & -3 \end{pmatrix} \begin{pmatrix} 5(2) + 7(-3) + 2(5) & 5(1) + 7(-2) + 2(0) \\ 1(2) + 2(-3) + (-3)(5) & 1(1) + 2(-2) + (-3)(0) \end{pmatrix} \\ = \begin{pmatrix} -1 & -9 \\ -20 & -3 \end{pmatrix}$$

Example

Let

$$A = \begin{pmatrix} -1 & -1 & 0 \\ 0 & 1 & 1 \end{pmatrix}$$

Find AA^T

Solution:

$$\begin{pmatrix} -1 & -1 & 0 \\ 0 & 1 & 1 \end{pmatrix} \begin{pmatrix} -1 \\ -1 \\ 0 \\ 0 \\ 1 \\ 1 \end{pmatrix}$$
$$\begin{pmatrix} -1 & -1 & 0 \\ 0 & 1 & 1 \end{pmatrix} \begin{pmatrix} -1(-1) + -1(-1) + 0(0) & -1(0) + -1(1) + 0(1) \\ 0(-1) + 1(-1) + (1)(0) & 0(0) + 1(1) + 1(1) \end{pmatrix}$$
$$= \begin{pmatrix} 2 & -1 \\ -1 & 2 \end{pmatrix}$$

Example

Let

$$A = \begin{pmatrix} -1 & -1 & 0 \\ 0 & 1 & 1 \end{pmatrix}$$

Find A^2

Solution:

$$\begin{pmatrix} -1 & -1 & 0 \\ 0 & 1 & 1 \end{pmatrix} \begin{pmatrix} -1 & -1 & 0 \\ 0 & 1 & 1 \end{pmatrix}$$

Which is **not** possible. Why?

Example

Multiply

$$\begin{pmatrix} 1 & 2 \\ 1 & 2 \end{pmatrix} \cdot \begin{pmatrix} 2 & -3 \\ -1 & \frac{3}{2} \end{pmatrix}$$

Solution:

$$\begin{pmatrix} 1 & 2 \\ 1 & 2 \end{pmatrix} \begin{pmatrix} 2 & -3 \\ -1 & \frac{3}{2} \end{pmatrix} \\ = \begin{pmatrix} 1(2) + 2(-1) & 1(-3) + 2(\frac{3}{2}) \\ 1(2) + 2(-1) & 1(-3) + 2(\frac{3}{2}) \end{pmatrix} \\ = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$$

Note: the integrality property does not hold in matrices!!! i.e., the following property does not hold

$$AB = 0 \rightarrow A = 0 \text{ or } B = 0$$

Exercise

(1) let

$$B = \begin{pmatrix} 1 & 5 & 2 \\ 0 & -2 & -4 \\ 3 & 0 & 5 \end{pmatrix}, C = \begin{pmatrix} 2 & 5 \\ 6 & 3 \\ 0 & -4 \end{pmatrix}$$

Find BC and $C^T B$.

Dr. Abdulla

Exercise

(2) let

$$A = \begin{pmatrix} 2 & 5 \\ -1 & 4 \\ 0 & -3 \end{pmatrix}, B = \begin{pmatrix} 6 & 10 & 7 \\ -2 & 3 & 1 \end{pmatrix}, C = \begin{pmatrix} 8 & -4 \\ -1 & 2 \end{pmatrix}$$

Find C^2 and $BA - 5I$.

Dr. Abdulla

Matrix representation of a system of linear equations

Example

Represent each of the following systems as product of matrices:

$$3x + y = 6$$

$$2x - 9y = 5$$

Solution:

$$\begin{pmatrix} 3 & 1 \\ 2 & -9 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} 6 \\ 5 \end{pmatrix}$$

Matrix representation of a system of linear equations

Example

Represent each of the following systems as product of matrices:

$$3x + y + z = 2$$

$$x - y + z = 4$$

$$5x - y + 2z = 12$$

Solution:

$$\begin{pmatrix} 3 & 1 & 1 \\ 1 & -1 & 1 \\ 5 & -1 & 2 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 2 \\ 4 \\ 12 \end{pmatrix}$$
